Requirement ID	Actor	Actor action	System response
UR-15	customer	log in	display result
UR-16	admin	log in	display result
UR-17	storage admin	log in	display result

5. **UI Mockups:**

I want to use cmd window to act as a UI, firstly. If I can, I would use Javascript to do it instead of.

```

Homework-3 — -bash — 80x24
please choose role: 1 customer 2 admin 3 storage admin
1
please choose action:
1: search product
2: view cart
3: view orders
1
please input your search key word in the format:
productname: xxx, brand: xxx
brand: Sunny
1. milk
2. bread
3. yogurt
please choose product number
1
please choose your action:
1. display product detail
2. add to cart
2
please choose your action:
2
please choose your action:
1. view cart
2. checkout

```

It is an interaction example above. It doesn't display all the actions. It is the basic goal. The optional for UI is to write a website.

6. **Class Diagram:**

The class diagram is drew by StarUML, I didn't find how to represent static attribute and static method. So I write the "static " key word directly. And the get set methods are not displayed in it.
